<b>Honors in Electric Vehicles</b>	<b>T.Y. B.Tech</b>	<b>Semester: V</b>
<b>Program: Mechanical Engineering</b>		
<b>Course: Fundamentals of Electric Vehicles (DJS22MEHN1C1)</b>		

**Pre-requisite:**

1. fundamentals of mechanical, electronics and electrical engineering.
2. Fundamentals of chemistry, physics and engineering mechanics.

**Objectives:**

1. To study different automotive components and subsystems used in electric vehicles.
2. To develop a comprehensive understanding of vehicle dynamics and stability principles.
3. To provide a broad understanding of transmission systems used in electric vehicles.
4. To understand the principles of electrochemical reactions in batteries and analyze the parameters governing battery performance and efficiency.
5. To equip students with the knowledge and skills necessary for the selection and sizing of electric motors for diverse applications, covering criteria assessment, performance analysis, and matching to load requirements.

**Outcomes:** On completion of the course, the learner will be able to:

1. To explain the fundamentals of electric vehicles and their major parts.
2. Classify the chassis used in electric vehicles and select a suitable body type for the given requirements.
3. Apply vehicle dynamics and stability principles to analyze and optimize vehicle performance, including maximum speed, gradability, and acceleration.
4. Differentiate between different types of transmission systems, including manual, automatic, AMT, and CVT, and select a suitable transmission system for a vehicle to be designed.
5. Evaluate different types of batteries based on their electrochemical properties and determine their suitability for specific applications.
6. Evaluate vehicle requirements, and motor criteria, and interpret performance characteristics to effectively select and size electric motors for various applications.

<b>Fundamentals of Electric Vehicles (DJS22MEHN1C1)</b>		
<b>Unit</b>	<b>Description</b>	<b>Duration</b>
<b>1</b>	<b>Introduction to Electric Vehicles (EV)</b> Brief history of EV; Electric vehicle market; Need of EV; Types of EVs and their components: BEVs, PHEVs, HEV, FCEV; EV specifications; General layouts of the EVs; Comparison of EV with other types of vehicles; Overview of EV manufacturers; National Policy for adoption of EVs; Chassis and body used in EV: Classification of chassis; frame; Body types; Vehicle dimensions; Body and chassis materials; Government regulations.	8
<b>2</b>	<b>Vehicle Dynamics and Stability</b> Types of wheel rims, wheel dimension; Tyre: properties, specifications, types, construction, tread patterns; Study principles of rolling, pitch and yaw velocity and moments; Drag, lifts, resistance, body loads and load calculation; Vehicle resistance: rolling resistance, grading resistance, aerodynamic drag; Dynamic equation, Vehicle performance (Maximum speed, gradeability and acceleration); Calculation of acceleration force, maximum speed; Tractive effort, Torque required on the wheel; Torque speed characteristics of electric vehicle; Aesthetics and ergonomics consideration for stability and control.	8

3	<b>Transmission Systems</b> Layout of transmission system and their components; Power Flows and Gear Ratios; Types of transmission: Manual, Automatic, Automated-Manual Transmissions, Continuously Variable Transmissions (CVT); Gear box design; Drive Layout - One/ Two/ Four /All-wheel drive layout, Transmission system Component design. Differential classification and Types: Open, Locked, Spool/ Welded, Limited Slip, Torsen, Active, Torque Vectoring. Clutch and its structure. Drivetrain and Differential.	8
4	<b>Steering, Suspension, and Braking System</b> <b>Steering System:</b> Geometry and classification; Layout and topology design: bicycle, tricycle, and Quadracycle; 4W configuration (2/3/4 Seater); Design of steering system. <b>Suspension System:</b> Classification; Components of the suspension system; Topology design; Design of Shock Absorbers, Coil Springs and linkages. <b>Wheels and Braking System:</b> Classification of wheels and tyres; Types of braking system; Topology design; Design of braking system; Integration of Wheel with traction motor, Braking system, Regenerative Braking.	10
5	<b>Power Unit: Batteries Technologies</b> Types of batteries: Lead acid battery, Nickel based batteries, Sodium based batteries, Lithium based batteries - Li-ion and Li-poly, Metal air battery, Zinc chloride battery, Graphene battery; Introduction to electrochemical battery; Electrochemical reactions; Battery parameters: Battery capacity, discharge rate, charging rate, SOC, SOD, SOH, DOD, thermodynamic voltage, specific energy, specific power, energy efficiency; Energy storage systems: Ultracapacitors; Flywheel energy storage system; Hydraulic energy storage system; Comparison of different energy storage system.	10
6	<b>EV Motors and Characteristics</b> Requirement of EV motors; Review of motor principles; Types of electric motors – construction and working; Motor load dynamics; Specifications of motors; Characteristic curves of motors; Motion profile: acceleration, steady operation and deceleration profiles; Starting, braking, speed and torque control of motors; Constant-torque mode, Constant-power mode; Efficiency map; Design variables of motors (introduction); Classification properties of PM material, Alnico, Ferrites, Rare-Earth PMs.	8
	<b>Total</b>	<b>52</b>

<b>Honors in Electric Vehicles</b>	<b>T.Y. B.Tech</b>	<b>Semester: VI</b>
<b>Program: Mechanical Engineering</b>		
<b>Course: Electric Drives and Controls (DJS22MEHN1C2)</b>		

**Pre-requisite:**

1. Fundamentals of electric vehicles.
2. fundamentals of mechanical, electronics, and electrical engineering.

**Objectives:**

1. To provide fundamental knowledge of power devices and power conversion techniques used in electric drive systems and their application in electric vehicles.
2. To study various sensors, observers, and modulation schemes used in electric drives for feedback and control purposes to achieve high accuracy and efficiency.
3. To explore the types and control strategies of DC motors, including brushed and brushless DC motors, focusing on their dynamics, characteristic curves, control methods, and four-quadrant operations.
4. To understand the construction, characteristics, and control methods of various AC motors, such as induction motors and permanent magnet motors, and their role in electric vehicle applications.
5. To analyze advanced motor types, such as Switched Reluctance Motors (SRM) and BLDC motors, their control strategies, characteristic curves, and applications in electric vehicle systems.
6. To provide knowledge on selecting and sizing electric motors based on application requirements, motion profiles, and real-life case studies, focusing on their torque-speed characteristics and efficiency.

**Outcomes:** On completion of the course, the learner will be able to:

1. Explain the power devices, voltage source and current source inverters, and power conversion techniques applicable to electric vehicles.
2. Select and implement appropriate sensors, observers, and modulation schemes to optimize electric drive performance.
3. Design and control DC motors, utilizing different control strategies to achieve desired performance and understand four-quadrant operations.
4. Apply the knowledge of AC motor control methods such as Variable-Voltage Variable-Frequency Control (VVVF), Field-Oriented Control (FOC), and Direct Torque Control (DTC).
5. Develop proficiency in controlling advanced motor drive topologies like SRM and BLDC motors, focusing on reducing torque ripple and improving motor efficiency.
6. Select and size appropriate motors for different EV applications, evaluate motor performance characteristics, and understand their suitability for various types of electric vehicles.

<b>Electric Drives and Controls (DJS22MEHN1C2)</b>		
<b>Unit</b>	<b>Description</b>	<b>Duration</b>
<b>1</b>	<b>Basics of power conversion:</b> <b>Power devices:</b> Silicon Controlled Rectifier (SCR), Triode for Alternating Current (TRIAC), Bipolar Junction Transistor (BJT), Metal-Oxide-Semiconductor Field-Effect Transistor (MOSFET) and Insulated-Gate Bipolar Transistor (IGBT). <b>Power Conversion:</b> DC-DC converters, DC-AC Converters, and AC-DC Converters used in EV applications. Voltage source inverter, Current source inverter; High power and low power loops; Converter/ Inverter Loss calculation; Heat-sinking: passive and active cooling.	12
<b>2</b>	<b>Elements of drives:</b>	8

	Encoders, Resolvers, R/D Converters, Hall current sensors and current sampling, Voltage Model Estimator, Current Model Estimator, Closed-loop MRAS observer, Sliding Mode Observer. <b>Modulation schemes:</b> Sinusoidal PWM, Injection of third order harmonics, Space Vector Modulation, Dead time & compensation, comparison of modulation techniques.	
3	<b>EV Motors Drive Topologies - 1</b> Need and functions of Motor Controller; <b>DC motor:</b> Brushed and Brushless DC motors (BLDC); BLDC motor drive; Basics of brushed DC Motor, DC Motor dynamics, Characteristic Curves; PMSM drives and SRM (synchronous reluctance motor) based drive. <b>DC Motor Control:</b> Single-phase uncontrolled rectifiers, half and fully-controlled rectifiers, chopper control, open and closed loop control. Current Loop Control, Speed Control Loop. Feedback Linearization; Four quadrant operation;	8
4	<b>EV Motors Drive Topologies -2</b> <b>AC Motors:</b> Induction motors (IM), permanent-magnet ac synchronous motor-surface permanent-magnet (SPM) motors, and interior-permanent-magnet (IPM) motors; constructional details and Characteristic Curves; <b>Induction Motor Control:</b> Starting methods and speed control of single-phase induction motors, Variable-Voltage Variable-Frequency Control (VVVF), Field-Oriented Control (FOC), Direct Torque Control (DTC); Field Weakening Control;	8
5	<b>EV Motors Drive Topologies -3</b> Switched Reluctance Motor (SRM); Basic construction details and working principles of SRM machine, Types of SRM. Characteristic Curves; SRM motor control: Current chopping control (CCC), Torque-Ripple Minimization Control; <b>BLDC Motor:</b> Basic principles of BLDC Motor, motor construction, Types of BLDC motors. Characteristic Curves; BLDC Motor Control: Trapezoidal back EMF BLDC motor control, sensor control; PM Synchronous Motor Control: Field-Oriented Control of PMSM, Flux-Weakening Control of PMSM, Position Sensorless Control of PMSM;	8
6	<b>Selection/ Sizing of Electric Motor</b> Overview of electric drives and their applications; Comparison of various types of electric drives; Motion profile: acceleration, steady operation, and deceleration profiles; Traction force calculation; Criteria for selecting electric motors: torque, speed, power rating, efficiency, etc.; Understanding motor performance characteristics: torque-speed curve, efficiency map, etc.; Considerations for motor sizing and matching to load requirements; Suitability of electric motor in different domains for 2-, 3-, 4-wheeler and large-size vehicles; Selection of cooling system; Real-life examples/case studies.	8
	<b>Total</b>	<b>52</b>

<b>Honors in Electric Vehicles</b>	<b>T.Y. B.Tech</b>	<b>Semester: VI</b>
<b>Program: Mechanical Engineering</b>		
<b>Course: Electric Vehicle Laboratory I (DJS22MEHN1L1)</b>		

**Pre-requisite:**

1. Fundamentals of electric vehicle;
2. Fundamentals of mechanical, electronics, and electrical engineering.
3. Fundamentals of chemistry, physics, and engineering mechanics.

**Objectives:**

1. To provide fundamental knowledge of power devices and power conversion techniques used in electric drive systems and their application in electric vehicles.
2. To study various sensors, observers, and modulation schemes used in electric drives for feedback and control purposes to achieve high accuracy and efficiency.
3. To explore the types and control strategies of DC motors, including brushed and brushless DC motors, focusing on their dynamics, characteristic curves, control methods, and four-quadrant operations.
4. To understand the construction, characteristics, and control methods of various AC motors, such as induction motors and permanent magnet motors, and their role in electric vehicle applications.
5. To analyze advanced motor types, such as Switched Reluctance Motors (SRM) and BLDC motors, their control strategies, characteristic curves, and applications in electric vehicle systems.
6. To provide knowledge on selecting and sizing electric motors based on application requirements, motion profiles, and real-life case studies, focusing on their torque-speed characteristics and efficiency.

**Outcomes:** On completion of the course, the learner will be able to:

1. Explain the power devices, voltage source and current source inverters, and power conversion techniques applicable to electric vehicles.
2. Select and implement appropriate sensors, observers, and modulation schemes to optimize electric drive performance.
3. Design and control DC motors, utilizing different control strategies to achieve desired performance and understand four-quadrant operations.
4. Apply the knowledge of AC motor control methods such as Variable-Voltage Variable-Frequency Control (VVVF), Field-Oriented Control (FOC), and Direct Torque Control (DTC).
5. Develop proficiency in controlling advanced motor drive topologies like SRM and BLDC motors, focusing on reducing torque ripple and improving motor efficiency.
6. Select and size appropriate motors for different EV applications, evaluate motor performance characteristics, and understand their suitability for various types of electric vehicles.

<b>Electric Vehicle Laboratory I (DJS22MEHN1L1)</b>	
<b>Sr. No.</b>	<b>Experiment Title</b>
<b>Study-Type Experiments (Theoretical and Conceptual Learning)</b>	
<b>1</b>	Study of Power Devices in Power Conversion Systems
<b>2</b>	Study the operation and applications of various converters used in electric vehicles and their effect on power efficiency.
<b>3</b>	Review different modulation schemes like Sinusoidal PWM, Space Vector Modulation (SVM), and third-order harmonic injection, and analyze their effectiveness.
<b>4</b>	Study of Motor Drive Topologies for Brushed and Brushless DC Motor :

5	Review the criteria for selecting and sizing electric motors for different vehicle categories, focusing on torque, speed, power ratings, and efficiency.
<b>Simulation-Based Experiments (Python/ MATLAB/ Simulink, etc.)</b>	
6	Simulation of Inverter and Converter Loss Calculation
7	Simulation of Motor Control Techniques for DC Motors
8	Simulation of Induction Motor Control Using Field-Oriented Control (FOC) and Direct Torque Control (DTC)
9	Simulation of BLDC Motor Control Using Trapezoidal Back EMF and Sensorless Control
10	Numerical Analysis of Motor Efficiency Map and Torque-Speed Characteristics
<b>Performance-Based Experiments (Hands-on)</b>	
11	Measure and analyze the efficiency, voltage, and current characteristics of a MOSFET-based DC-DC converter under different load conditions.
12	Performance Evaluation of a Brushed DC Motor under Different Load Conditions
13	Efficiency Measurement of Induction Motors with Variable Voltage and Frequency Control (VVVF)
14	Testing of Switched Reluctance Motor Control for Torque Ripple Minimization
15	Testing of BLDC Motor Drive with Sensored and Sensorless Control

#### List of Experiments (Any 8)

A minimum of eight experiments from the above-suggested list or any other experiment based on the syllabus will be included, which would help the learner to apply the concept.

<b>Honors in Electric Vehicles</b>	<b>T.Y. B.Tech</b>	<b>Semester: VII</b>
<b>Program: Mechanical Engineering</b>		
<b>Course: Energy Source Management (DJS22MEHN1C3)</b>		

**Pre-requisite:**

1. Fundamentals of electric vehicles;
2. Electric drives and controls;

**Objectives:**

1. To provide a comprehensive understanding of various energy sources and battery technologies.
2. To equip students with knowledge about the design and modeling of battery packs, including electrical and mechanical design aspects.
3. To explore thermal issues in battery packs, their impact on capacity and cycle life, and the design of cooling strategies and materials for efficient thermal management.
4. To familiarize students with different charging methods and infrastructure, charging standards, and protocols, including the impact of electric vehicles on the existing power grid.
5. To provide insights into energy storage plants, global and Indian energy scenarios, and policies related to energy conservation and sustainability, emphasizing the role of energy in economic development.
6. To impart knowledge on energy management strategies, optimization techniques, and in-vehicle communication networks.

**Outcomes:** On completion of the course, the learner will be able to:

1. To describe different types of batteries, including lithium-ion batteries, and explain their components, materials, and construction, as well as design considerations for battery packs.
2. To develop and simulate battery pack designs using equivalent circuit models, analyze electrical and mechanical design considerations, and evaluate the safety and reliability of battery structures.
3. To identify thermal issues in battery systems and implement suitable thermal management strategies, cooling methods, and materials for effective heat dissipation and safety.
4. To demonstrate the knowledge of AC and DC charging methods, battery chargers, and charging protocols, and will be able to assess the design and installation requirements for charging infrastructure.
5. To explain the role of energy storage systems in different load scenarios, the global and Indian energy scenarios, and the impact of energy policies on conservation and economic development.
6. To compare and classify different energy management strategies, apply optimization techniques, and address implementation challenges in energy management systems for electric vehicles.

<b>Energy Source Management (DJS22MEHN1C3)</b>		
<b>Unit</b>	<b>Description</b>	<b>Duration</b>
<b>1</b>	<b>Energy Sources and Battery Technology:</b> Introduction to energy sources; Batteries: primary and secondary; Performance parameters; <b>Lithium-ion batteries:</b> Components; Materials: cathode and anode; Electrolytes: salts and solvents, separators; Battery cells: cylindrical, prismatic, and pouch cells. <b>Battery pack design considerations:</b> Requirements; Development process; Types and selection; Determination of power, voltage, and capacity of the battery pack; Trade-off between parallel and series cell connections, PCM, and SCM;	8
<b>2</b>	<b>Battery Pack Design, Modelling, and Simulation - II</b> <b>Equivalent Circuit Modelling:</b> Modelling OCV and SOC; Voltage polarization, Warburg impedance; Estimation of Model parameter values: OCV, Columbic Efficiency, total	12

	<p>capacity, temperature dependence of OCV, using the ECM to simulate constant voltage/ power charge/ discharge characteristics.</p> <p><b>Electrical Design:</b> Design considerations; Conductor material selection; Busbar sizing; Short circuit; Conductor insulation; Contact resistance; Voltage drop and its significance; Current equalization in parallel path; Testing and standards.</p> <p><b>Mechanical Design Aspects:</b> Design consideration; Forces acting; Noise and vibration; Material used; Layout-specific battery location selection; Battery pack structure; Compartment design for crashworthiness and cooling; Ashby Methodology, Battery Swelling.</p>	
<b>3</b>	<p><b>Thermal Design of Battery Pack</b></p> <p>Thermal issues; Impact of temperature on capacity; Cycle life, and thermal runaway; Considerations for thermal design; Heat generation; Heat load determination; Energy flow in first principles; Modes of battery thermal management;</p> <p><b>Cooling systems:</b> Forced air convection; Liquid cooling; Immersion cooling; Peltier cooling; Heat sink natural convection; Heat pipe cooling;</p> <p><b>Cooling strategies:</b> Direct/ indirect cooling, Air cooling, liquid cooling, PCM-based cooling, advanced cooling methods;</p> <p>Materials: Thermal interface material; Phase change material; Thermal insulations; Temperature sensing and monitoring.</p>	10
<b>4</b>	<p><b>Battery Charging Infrastructure</b></p> <p>Introduction; AC and DC charging; CC-CV charging; Pulse charging; Battery Chargers: on-board and off-board; Standards and protocols; Types: Fast DC chargers; Home and public charging; Wireless Power Transfer (WPT) technologies; Move-and-charge technology; Selection and sizing of charging station; Single line diagram of charging station; Design considerations of AC and DC fast charger: vehicle interface and charging protocol.</p> <p>Charging Infrastructure-standardization and connectivity issues; SAE J1772, CHAdeMo, GB/T, CCS2 battery charging protocols.</p> <p>OCPP protocol Impact on existing power grid, G2V and V2X- Vehicle-to-home (V2H), vehicle-to-vehicle (V2V), and vehicle-to-grid (V2G) energy systems.</p> <p>Renewable Energy Based Charging infra. <b>Honors in Electric Vehicles</b>	<b>T.Y. B.Tech</b>	<b>Semester: VII</b>
<b>Program: Mechanical Engineering</b>		
<b>Course: Electric Vehicle Laboratory II (DJS22MEHN1L2)</b>		

**Pre-requisite:**

1. Fundamentals of electric vehicles
2. Electric drives and controls

**Objectives:**

1. To develop a thorough understanding of various energy sources and advanced battery technologies.
2. To equip students with the skills to design and model battery packs, addressing both electrical and mechanical design considerations.
3. To examine thermal challenges in battery systems, including their impact on capacity and cycle life, and to design efficient cooling strategies and select appropriate thermal management materials.
4. To familiarize students with diverse charging methods, infrastructure, standards, and protocols.
5. To provide insight into energy storage solutions, global and national energy scenarios, and policies that promote energy conservation, focusing on their influence on sustainable economic growth.
6. To impart knowledge on energy management strategies, optimization techniques, and in-vehicle network communication essential for efficient energy utilization in electric vehicles.

**Outcomes:** On completion of the course, the learner will be able to:

1. Describe various battery types, their components, materials, and construction.
2. Develop and simulate battery pack designs using equivalent circuit models, analyze key electrical and mechanical aspects.
3. Identify thermal challenges in battery systems and implement effective thermal management strategies, cooling methods, and materials for optimal heat dissipation and safety.
4. Demonstrate understanding of AC and DC charging methods, battery chargers, and charging protocols.
5. Discuss the role of energy storage systems in various load scenarios.
6. Compare and classify energy management strategies, apply optimization techniques, and address implementation challenges within energy management systems for electric vehicles.

<b>Electric Vehicle Laboratory II (DJS22MEHN1L2)</b>	
<b>Sr. No.</b>	<b>Experiment Title</b>
	<b>Study-Type Experiments (Theoretical and Conceptual Learning)</b>
<b>1</b>	Study of Lithium-ion Battery Components and Types
<b>2</b>	Analysis of Battery Pack Design and Development Process
<b>3</b>	Overview of Thermal Management Techniques in Battery Packs
<b>4</b>	Exploration of Battery Charging Infrastructure and Standards
<b>5</b>	Study of Energy Management Strategies in Hybrid and Electric Vehicles
	<b>Numerical Analysis Experiments (Python/ MATLAB/ Simulink, etc.)</b>
<b>6</b>	Simulation of Equivalent Circuit Models (ECM) for Battery Systems
<b>7</b>	Simulation of Thermal Analysis in Battery Packs
<b>8</b>	Simulation of Battery Charging Techniques and Control
<b>9</b>	Simulation of Energy Storage and Load Distribution
<b>10</b>	Simulation of Energy Management Strategy in Hybrid Vehicles
	<b>Performance-Based Experiments (Hands-on and Simulation Tools)</b>
<b>11</b>	Performance Evaluation of Lithium-Ion Battery under Different Discharge Rates
<b>12</b>	Efficiency and Loss Calculation in a DC-DC Converter for EV Applications

13	Performance Testing of Cooling Systems in Battery Packs
14	Performance Analysis of On-board and Off-board Battery Chargers
15	Testing of Energy Storage System for Peak Load Management

### List of Experiments (Any 8)

A minimum of eight experiments from the above-suggested list or any other experiment based on the syllabus will be included, which would help the learner to apply the concept.

<b>Honors in Electric Vehicles</b>	<b>Final Year B.Tech</b>	<b>Semester: VIII</b>
<b>Program: Mechanical Engineering</b>		
<b>Course: Electric Vehicle System Design and Safety (DJS22MEHN1C4)</b>		

**Pre-requisite:**

1. Fundamentals of electric vehicle
2. Electric drives and control
3. Energy sources and management

**Objectives:**

1. To provide a comprehensive understanding of aesthetic design principles and their unique application to EVs.
2. To familiarize students with ergonomic principles for EV design, addressing user comfort, interface accessibility, and agronomical insights.
3. To introduce students to advanced safety, risk, hazard, and reliability analysis methods in EV systems.
4. To teach students about EV safety and testing standards.
5. To impart knowledge on fuel cell technology within EVs, exploring various types of fuel cells, materials, and safety concerns.
6. To analyze the economics of EVs, including life cycle cost analysis, incentives, and the impact of electricity pricing on charging patterns and grid support.

**Outcomes:** On completion of the course, the learner will be able to:

1. Explain and apply the principles of aesthetic design (both exterior and interior) in electric vehicles.
2. Apply ergonomic design principles to enhance the EV user experience, emphasizing comfort, accessibility, and user-centered control interfaces.
3. Perform safety and reliability analyses on EV components using techniques like FTA, FMEA, and RBD to predict and mitigate potential failures.
4. Demonstrate understanding of EV safety standards, conduct testing, and apply best practices for thermal, environmental, and crash safety.
5. Describe fuel cell operation in EVs, distinguishing between types of fuel cells, safety issues, and recent technological advancements.
6. Apply economic considerations to estimate the life cycle cost (LCC) of the electric vehicles.

<b>Electric Vehicle System Design and Safety (DJS22MEHN1C4)</b>		
<b>Unit</b>	<b>Description</b>	<b>Duration</b>
1	<b>Aesthetics Design in EVs</b> Overview of aesthetic design in the automotive industry; Aesthetic design; Role of shape, proportions, and design lines; Colour psychology; Surface treatment and finish; Comparison of traditional vehicles and EVs; <b>Exterior design:</b> aerodynamics, styling, integration of sensors and cameras into exterior design; Material and color choices, Lighting design - headlamps, tail lamps, and ambient lighting; <b>Interior design:</b> customization, display and dashboard design, control units, seat design, material used for interiors and its selection; <b>Design Technologies:</b> CAD and 3D modeling software, AR and VR; Sustainable design.	8
2	<b>Design for Ergonomics</b> Basics of ergonomics and human-centered design principles; Goals of ergonomic design: Comfort, accessibility, and safety; Understanding user demographics and physiological needs; Driver and Passenger Comfort: seating design, ingress and egress, seat material; Control and Interface – simplified dashboard layout, steering wheel and pedal ergonomics;	10

	Cabin air quality and lighting: air quality systems, ambient lighting, NVH management; User interface and display design: Heads-Up Display (HUD), Multi-functional displays. <b>Integrating Agronomical Insights from Nature and Agriculture:</b> Drawing inspiration from agronomy such as energy efficiency, modularity, and adaptability, energy-efficient materials, modularity in design, biophilic design principles, regenerative systems.	
3	<b>Safety, Hazard, and Risk Analysis of Electric Vehicle Systems</b> Life cycle phases of EV; Customer satisfaction; Reliability vs. durability in EVs; System analysis methods: Fault Tree Analysis (FTA); Failure Modes and Effects Analysis (FMEA); Reliability Block Diagrams (RBD); Reliability analysis of batteries and power electronics; Markov Chains and state-space models; Condition monitoring and predictive maintenance; Reliability allocation and optimization; Analysis of component failure modes, aging effects, and thermal degradation. Impact of reliability on EV range and performance.	10
4	<b>EV Safety and Testing Standards</b> Testing in EV Components: environmental, thermal cycling, vibration, and shock testing; Accelerated Life Testing (ALT); Software Reliability in EV Systems; <b>Safety in EV Design:</b> Thermal runaway in batteries, short circuit protection, fault diagnosis, and fire hazards in EV systems. <b>Safety Standards and Regulations:</b> ISO 26262 for functional safety, battery safety standards (IEC 62619, UL 2580), crashworthiness, and passenger safety. <b>Testing and Validation:</b> Battery testing (electrical, thermal, mechanical), powertrain testing, IP ratings for weather protection, and electromagnetic compatibility (EMC) testing. <b>Battery Recycling and Disposal:</b> End-of-life considerations, recycling processes, environmental impact, and regulations for safe disposal of battery packs.	10
5	<b>Fuel Cell and Electric Vehicles</b> Fuel cell technologies; Working mechanism of fuel cells; Types of fuel cells – PEMFC, SOFC, AFC, PAFC, DMFC, MCFC; Materials for electrodes, electrolytes, and other components; Hydrogen generation and storage - limitations, recent progress in fuel cells, safety issues and cost expectation; Life cycle analysis of fuel cells.	8
6	<b>Economics of Electric Vehicle</b> Product life cycle curve for EV; Life Cycle Cost (LCC) elements: acquisition cost, operating cost, maintenance cost, disposal cost/ net salvage value; Annualized life cycle costing; Grid supply-side incentives; EV purchased incentives; Impact of electricity prices on charging and discharging pattern; Charging infrastructure incentives; Economic efficiency; Computation of electricity cost of charging of HEV, circular economy, reuse of EV components.	6
	<b>Total</b>	<b>52</b>
